### **APPENDIX B**

## **Tips and Tricks**

#### What we'll cover:

- Tips and tricks on code selections
- How to move blocks of code around
- Working in columnar format
- Code formatting
- Views

Before we end the book, I'd like to leave you with a couple more tips and some tricks that, I think, are really helpful.

## **Selecting Code**

Are you still using the mouse to highlight code blocks? That's alright. But IntelliJ gives us another way to (more quickly) work with blocks of code.

You can use the **Option + Up arrow** (macOS) or **CTRL + W** (Windows, Linux) to extend your text selection and include ever-increasing, valid blocks of code. Use the **Option + Down arrow** (macOS) or **CTRL + Shift + W** (Windows, Linux) to decrease the selection. This key is actually smart enough to select the proper demarcations for the code blocks — Figure B-1 shows a snapshot when I was trying out this feature.

```
🕏 MainProgram.java 🗡
                    C AnotherOne.java ×
        public class MainProgram {
 2
          public static void main(String[] args) {
            String str = "The quick brown fox jumped over " +
                "the head of the lazy dog " +
                "near the riverbank";
 7
            System.out.println(str);
8
9
                                                  Ĭ
         void anotherMethod() {
10
            System.out.println("Lorem ipsum");
11
          }
12
13
       }
```

Figure B-1. Selecting blocks of code

## **Columnar format**

If, for some reason, you need to work with text in a columnar format — like shown in Figure B-2 — IntelliJ has got you covered, too.

```
C AnotherOne.java X
 🕏 MainProgram.java 🔀
       public class MainProgram {
          public static void main(String[] args) {
            String str = "The quick brown fox jumped over " +
                "the head of the lazy dog " +
                "near the riverbank";
            System.out.println(str);
8
9
         void anotherMethod() {
10
            System.out.println("Lorem ipsum");
11
                                                           Ϊ
          }
12
       }
13
```

Figure B-2. Column select

You need to toggle IntelliJ's Column Select mode; by default, it's off. You've got to turn it on. There are a couple of ways to do it. You can use the keys **Command + Shift + A** (macOS) or **CTRL + Shift + A** (Windows, Linux) — you'll remember these keys as the Find Action keys. Or, just use the ever-reliable and unforgettable Double Shift key shortcut (Search everywhere); then, type "column select" (as shown in Figure B-3).

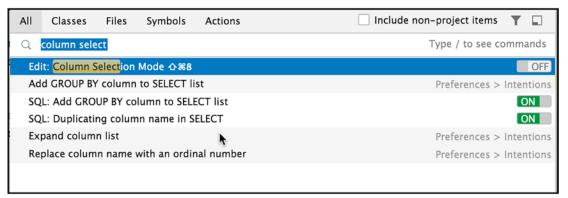

Figure B-3. Column Select mode

## Moving code blocks

If you've been copying and pasting blocks of code or statements just to move them around, here's another handy trick in IntelliJ.

You can use the keys **Shift + Command + Up Arrow** (macOS) or **CTRL + Shift + Up Arrow** (Linux, Windows) to move whole statements (even multi-line ones) or entire methods.

## **String Manipulation**

Did you ever have to work with a long string in your code? That was a rhetorical question. Of course, you have. Remember the fun of checking if each line of string was properly enclosed in double-quotes? And checking to see if you actually concatenated them properly — like this.

#### APPENDIX B TIPS AND TRICKS

```
public static void main(String[] args) {
   String str = "The quick brown fox ";
      str += "jumped over the head ";
      str+= "of the lazy dog";
   System.out.println(str);
}
```

Well, with IntelliJ, you don't have to manually concatenate long strings over many lines. You can start with a long string, like in the code snippet below.

```
public static void main(String[] args) {
   String str = "The quick brown fox jumped over the head of the lazy dog
   near the riverbank";
   System.out.println(str);
}
```

Then, just place the caret symbol wherever you like within the string, then press ENTER. IntelliJ IDEA will automatically close off the String on the line above, add the '+' symbol for concatenation, and reopen the String on the line below. It will result in something like this.

```
public static void main(String[] args) {
   String str = "The quick brown " +
      "fox jumped over the head of " +
      "the lazy dog near " +
      "the riverbank";
   System.out.println(str);
}
```

On the other hand, if you'd like to rejoin the lines together, try the keys **CTRL** + **Shift** + **J** (same keys on macOS, Windows, and Linux).

These keyboard shortcuts are useful when working with block comments and multiline strings.

this figure will be printed in b/w

## **Formatting Code**

If you've been manually deleting and adding tabs to prettify your code, IntelliJ has a neat little trick for quickly formatting your code. Consider Figure B-4; it's obviously poorly formatted.

```
😅 MainProgram.java 🗡 😊 AnotherOne.java 🗵
        public class MainProgram {
 2
          public static void main(String[] args) {
 4
                         String str = "The quick brown fox jumped over " +
 5
                 "the head of the lazy dog " +
                       "near the riverbank";
 6
 7
                  System.out.println(str);
 8
 9
          void anotherMethod() {
10
            System.out.println("Lorem ipsum");
11
                                                                     Ŧ
          }
12
13
        }
14
```

Figure B-4. Poorly formatted code

You can use the keys Option + Command + L (macOS) or CTRL + Alt + L (Linux, Windows) to quickly format the code. Figure B-5 shows the same code (as the one shown in Figure B-4), but this time, after applying the quick format.

```
MainProgram.java 🗙 🧿 AnotherOne.java 🗵
        public class MainProgram {
2
          public static void main(String[] args) {
3
            String str = "The quick brown fox jumped over " +
                "the head of the lazy dog " +
                "near the riverbank";
7
            System.out.println(str);
8
         }
9
         void anotherMethod() {
10
            System.out.println("Lorem ipsum");
11
         }
12
       }
13
14
```

Figure B-5. Properly formatted code

## Finding a word in the File

As well as using  $\Re F$ , or **Ctrl** F, to find something, you can use  $\Re G$ , or F3, to find the next occurrence of the word currently at the caret and move to it. Alternatively, use  $^{\Re}G$  or **Ctrl**+**Alt**+**Shift**+**J** to select all instances of the current word.

I'm sure you already know how to find a word in a file. It's **Command** +  $\mathbf{F}$  (macOS) or CTRL +  $\mathbf{F}$  (Linux, Windows). Let's just add a little bit to your word-hunting arsenal. You can also use **Command** +  $\mathbf{G}$  or  $\mathbf{F3}$  to find the next occurrence of the word. Alternatively, you can use **CTRL** + **Command** +  $\mathbf{G}$  or **CTRL** +  $\mathbf{Alt}$  +  $\mathbf{Shift}$  +  $\mathbf{J}$  to select all instances of the current word.

# this figure will be printed in

## **Select and Surround**

To add quotes around a word or words, highlight the text and type the quote. This also works for all types of brackets. The quotes or brackets will be placed directly outside the highlighted text.

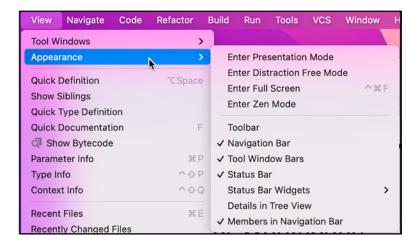

## **Views**

You can get more screen real estate by hiding all the tool windows individually. You can also use **Command** + **Shift** + **F12** (macOS) or **CTRL** + **Shift** + **F12** (Linux, Windows).

```
Hello – MainProgram.java
MainProgram ▼ ▶ 🍎 🖒 🚱 ▼ 🗏 Q 🕥
  💣 MainProgram.java 🗴 😊 AnotherOne.java
        public class MainProgram {
          public static void main(String[] args) {
            String str = "The quick brown fox jumped over " +
               "the head of the lazy dog " +
                "near the riverbank";
            String anotherString =" Hello there";
  8
  9
            System.out.println(str);
          void anotherMethod() {
 12
            System.out.println("Lorem ipsum");
 13
 14
 15
 16
        ▶ Run
                                                                                                              1 Event Log
  Code inspection did not find anything to report. 1 files processed in 'File '.../src/MainProgram.java". (28 minutes ago)
                                                                                                 7:1 LF UTF-8 2 spaces 🚡
```

Figure B-6. Maximized code editor view

If you want to experiment a bit more on the available coding views, go to the main menu bar, then View ➤ Appearance (as shown in Figure B-7). Try out *Presentation, Distraction-Free, Fullscreen* or *Zen* mode.

*Figure B-7.* View ➤ Appearance

## **Key Takeaways**

- IntelliJ is a chockful of goodies when it comes to coding assistance in.
  The Tip of the Day dialog is a good start in discovering these goodies.
  If you turned it off, you could always get to it by using the double Shift key, then type "tip of the day".
- IntelliJ favors the touch-typist, almost all of the actions you can do
  within the IDE has a keyboard shortcut. Learning these shortcuts will
  be time well-spent. You can look at the keymaps in the Preferences or
  Settings dialog but a really quick way to get to it is double shift key,
  then type "keymap".
